# Part 1: The Structure of Atoms

**Democritus**, a famous Greek teacher proposed the idea of the atom. Democritus said that all matter was made of tiny, indivisible particles. Called these particles atoms.

Aristotle believed that there was no empty space, therefore atoms could not move through empty space. He also believed that matter is made of earth, fire, air and water.

### **Dalton Atomic Theory**

- Matter is composed of extremely small particles called atoms.
- Atoms are indivisible and indestructible.
- Atoms of a given element are identical in size, mass, and chemical properties.
- Atoms of a specific element are different from those of another element.
- Different atoms combine in simple whole-number ratios to form compounds.
- In a chemical reaction, atoms are separated, combined, or rearranged.
- When an electric charge is applied, a ray of radiation travels from the cathode to the anode, called a cathode ray.
- · Cathode rays are a stream of particles carrying a negative charge. The particles carrying a negative charge are known as

**Robert Millikan** used the oil-drop experiment to determine the charge of an electron.

Ernest Rutherford studied how positively charged alpha particles interacted with the solid matter by aiming the particles at a thin sheet of

- Although most of the alpha particles went through the gold foil, a few of them bounced back, some at large angles
- · Almost all of the atom's positive charge and almost all of its mass are contained in a dense region in the center of the atom called the
- The repulsive force between the positively charged nucleus and positive alpha particles caused the deflections.
- Positively charged particles in the nucleus called *protons*.
- Neutrons, neutral particles in the nucleus.

The number of protons in the nucleus is the <u>atomic number</u>

- The sum numbers of protons and neutrons is called the atomic mass number
- · Atoms are electrically neutral because they have equal numbers of protons (positively charged) and electrons (negatively charged). If an atom gains or loses one or more electrons.
- Atoms with the same number of protons but different numbers of neutrons are called *isotopes*
- One atomic mass unit (amu) is defined as 1/12th the mass of a carbon-12 atom.
- One amu is nearly, but not exactly, equal to one proton and one neutron.

scientists noticed some substances spontaneously emitted radiation, a process they called *radioactivity*.

- The rays and particles emitted are called radiation.
- A reaction that involves a change in an atom's nucleus is called a nuclear reaction. Nuclear reactions can change one element into another element.
- Unstable nuclei lose energy by emitting radiation in a spontaneous process called radioactive decay
- There are three types of radiation: alpha, beta, and gamma
- Alpha radiation is made up of positively charged particles called alpha particles. Each alpha particle contains two protons and two neutrons and has a 2+ charge
- Beta radiation is radiation that has a negative charge and emits beta particles, each beta particle is an electron with a
- During *Beta decay*, a neutron is converted to a proton and an electron.

Gamma rays are high-energy radiation with no mass and are neutral. They usually accompany alpha and beta radiation.

#### First to propose the idea of atoms... 01 CH **A** Aristotle **B** Democritus 3 C Dalton **D** Bohr

Democritus said that all matter was made of tiny,

indivisible particles • Called these particles atoms. →B

Believed that all matter is continuous and  $O_2$ composed of varying amounts of air, earth, fire and water

**CH A** Aristotle **B** Democritus

> C Dalton **D** Bohr Aristotle believed that matter is made of earth, fire, air and water.

#### Q3 from Dalton's atomic theory: matter is composed of ....

CH A Electrons

**B** Protons

3 C Neutrons **D** Atoms

John Dalton revived the idea of the atom in the early 1800s based on numerous chemical reactions.

**Part 2: Chemical Reactions** 

The process by which one or more substances are rearranged to form different substances is called a *chemical reaction*.

 $\rightarrow$ C

Evidence that a chemical reaction may have occurred: - Change in temperature

- Change in color - Odor - Gas bubbles - Appearance of a solid

Chemists use statements called *equations* to represent chemical reactions. **Reactants** are the starting substances.

**Products** are the substances formed in the reaction. A **chemical equation** is a statement that uses chemical formulas to show the identities and relative amounts of the substances involved in a chemical reaction.

**Types of Chemical Reactions:** 

- <u>Synthesis reaction (Combination)</u>:  $A + B \rightarrow AB$ 

Reaction in which two or more substances react to produce a single product.

- <u>Decomposition reaction</u>: AB  $\rightarrow$  A + B

One in which a single compound breaks down into two or more elements or new compounds.

**Combustion reaction**: Oxygen combines with a substance and releases energy in the form of heat and light.

Ex:  $-4Na + O_2 \rightarrow 2Na_2O - CH_4 + 2O_2 \rightarrow CO_2 + 2H_2O$ 

- Single replacement reaction:  $A + BX \rightarrow AX + B$ 

A reaction in which the atoms of one element replace the atoms of another element in a compound.

Metal will not always replace metal in a compound dissolved in water because of differing reactivities.

An activity series can be used to predict if reactions will occur.

Double replacement reactions  $AY + BX \rightarrow AX + BY$ 

occur when ions exchange between two compounds. All double replacement reactions produce either liquid water, liquid, precipitate, or a gas.

Q31 Rearranging the atoms of two or more elements to form different substances is called...

CH **A** A chemical reaction

**B** A chemical equation

C Chemical equilibrium

**D** Rate of chemical reaction

The process by which one or more substances are Rearranged to form different substances is called a chemical reaction.

In combustion: a substance reacts with... CH A Hydrogen B Oxygen C Chlorine D Nitrogen

Oxygen combines with a substance and releases energy in the 3 form of heat and light.

Q33 Reaction with a single reactant is...

CH **A** Decomposition

3

 $\rightarrow$ A

**B** Replacement

C Combustion

**D** synthesis

Decomposition reaction: One in which a single compound breaks down into two or more elements

or new compounds.

**O**34 The type of reaction that produces one product

 $\mathbf{CH}$ **A** Decomposition **B** Replacement

**C** Combustion

**D** Synthesis

Synthesis reaction (Combination): Reaction in which two or more substances react to produce a single product.

 $\rightarrow$ D $\rightarrow$ 

3

**O32** 

 $\rightarrow$ D

#### The type of reaction $2Na + Cl_2 \rightarrow 2NaCl$ is ... **O**35

- CH A Decomposition
- **B** Replacement
- C Combustion
- **D** Synthesis

Synthesis reaction (Combination): Reaction in which two or more substances react to produce

a single product.

#### Q36 Which of the following reaction a decomposition reaction

- CH  $A N_2 + 3H_2 \rightarrow 2NH_1$
- 3
- B  $2KClO_3 \rightarrow 2KCl + 3O_2$
- $C \quad Cd(NO_3)_2 + H_1S \rightarrow CdS + 2HNO_3$
- $D \quad C_2H_6 + O_2 \rightarrow 2CO_2 + 3H_2$

Decomposition reaction: One in which a single compound breaks down into two or more elements or new compounds.

#### Q37 Which of the following reaction a decomposition reaction

- CH  $\mathbf{A} \quad \mathbf{H}_2 \ + \ \mathbf{O}_2 \ \rightarrow \ \mathbf{H}_2\mathbf{O}$
- **B** Na +  $H_2O \rightarrow NaOH + H_2$ 
  - C NaHCO<sub>3</sub>  $\rightarrow$  NaOH + H<sub>2</sub>O + CO<sub>2</sub>
  - $\mathbf{D} \quad \mathrm{C_4H_8} \, + \mathrm{O_2} \, \rightarrow \, \mathrm{CO_2} \, + \, \mathrm{H_2O}$

Decomposition reaction: One in which a single compound breaks down into two or more elements or new compounds.

## **Q38** Which of the following reaction is a single replacement

- CH A  $2Fe + 3Br_2 \rightarrow 2FeBr_3$ 
  - **B**  $\mathbf{K}(s) + \mathbf{NaCl}(aq) \rightarrow \mathbf{KCl}(aq) + \mathbf{Na}(s)$ 
    - $N_2 + 3H_2 \rightarrow 2NH$
    - **D**  $NaCl(aq)^2 + AgNO3(aq) \rightarrow NaNO3(aq) + AgCl(s)$

A reaction in which the atoms of one element replace the atoms of another element in a compound.

#### 039 Which of the following reaction is a double replacement reaction

- CH A  $C_6H_{12} + 9O_2 \rightarrow 6CO_2 + 6H_2O$ 
  - 3  $\mathbf{B} \quad \mathbf{O}_3 \rightarrow \mathbf{O}' + \mathbf{O}_2$ 
    - C  $CaCO_3 \rightarrow CaO + CO_7$
    - **D**  $\operatorname{Na_3PO_4}(aq) + 3(\operatorname{KOH})_3(aq) \rightarrow \operatorname{NaOH}(aq) + K_3\operatorname{PO_4}(s)$

A reaction in which the atoms of one element replace the atoms of another element in a compound.

#### **Q40** Which of the following reaction is a combustion reaction?

CH

3

- A  $C_6H_{12} + 9O_2 \rightarrow 6CO_2 + 6H_2O$
- $\mathbf{B} \quad 2\mathbf{H}_2\mathbf{O} \rightarrow 2\mathbf{H}_2 + \mathbf{O}_2$ 
  - C  $CaCO_3 \rightarrow CaO + CO_2$
  - **D**  $Na_3PO_4(aq) + 3(KOH)_3(aq) \rightarrow NaOH(aq) + K_3PO_4(s)$

Combustion reaction: Oxygen combines with a substance →A

#### **Q41** The separation of the components of sodium chloride (NaCl) is ...

- CH A Decomposition
- **B** Replacement
- C Combustion
- **D** Synthesis

Decomposition reaction: One in which a single compound breaks down into two or more elements or new compounds.

- 042 The type of reaction
  - $CaCO_3 \rightarrow CaO + CO_5$ , is ...
- CH A Decomposition
- **B** Replacement
- 3 C Combustion
- **D** Synthesis

Decomposition reaction: One in which a single compound breaks down into two or more elements or new compounds.

- 043 Which of the following reactions can occur?
- CH A Na + KCl  $\rightarrow$
- $K + NaCl \rightarrow$ 3
  - C  $Br_2 + NaCl \rightarrow$
  - $D I_2 + NaCl \rightarrow$

An activity series can be used to predict if reactions will occur.

- **O44** Which of the following reactions cannot occur?
- $\text{Li} + \text{KCl} \rightarrow$ CH
  - 3  $K + NaCl \rightarrow$ B
    - $Na + CaCl_2 \rightarrow$  $\mathbf{C}$
    - $Li + NaCl \rightarrow$

An activity series can be used to predict if reactions will occur.

- Q45 Which of the following reactions represent combustion and synthesis reactions at the same time?
- CH A  $2Fe + 3Br_2 \rightarrow 2FeBr_3$
- 3 B  $2Ca + O_2 \rightarrow 2CaO$ 
  - $CH_4 + O_2 \rightarrow CO_2 + H_2O$
  - D Li + NaCl  $\rightarrow$  LiCl + Na

Synthesis reaction (Combination): Reaction in which two or more substances react to produce a single product.

Combustion reaction: Oxygen combines with a substance

#### Predict the results of the following reaction **Q46**

- Na + AlCl<sub>3</sub>  $\rightarrow$
- $\mathbf{CH}$ A NaCl + AlCl<sub>2</sub>
- $NaCl_2 + Al$ 
  - C 3NaCl + Al
  - NaCl<sub>3</sub>+ Al

An activity series can be used to predict if reactions will occur.

- **O47** Which of the following reaction is a double replacement reaction
- CH A  $Ca + O_2 \rightarrow CaO$
- $B O + O \rightarrow O_3$ 
  - $C CaO + CO_2 \rightarrow CaCO_3$
  - $\mathbf{D} \quad \mathbf{NaOH}_{(\mathbf{aq})} + \mathbf{HCl}_{(\mathbf{aq})} \rightarrow \mathbf{NaCl}_{(\mathbf{aq})} + \mathbf{H}_2\mathbf{O}_{(1)}$

A reaction in which the atoms of one Element replace the atoms of another **→**D element in a compound.

- The reaction  $\mathbf{H}_2\mathbf{CO}_3 \rightarrow \mathbf{CO}_2 + \mathbf{H}_2\mathbf{O}$  is 1
- Do **A** Combination
- **B** Decomposition
- C Combustion
- **D** Replacement

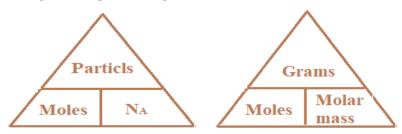

# Part 3: The Mole

The **mole** is an SI base unit used to measure the amount of a substance. Avogadro's number is  $N_A = 6.02 \times 10^{23}$ 

The molar mass of a compound tells you the mass of 1 mole of that substance.

To find the molar mass of a compound:

- 1. Use the chemical formula to determine the number of each type of atom present in the
- 2. Multiply the atomic weight (from the periodic table) of each element by the number of atoms of that element present in the compound.
- 3. Add it all together and put units of grams/mole after the number.

How many atoms are there in 2 mol of Lithium (Li)?

$$(N_A = 6.02 \times 10^{23})$$

 $\mathbf{CH}$ A  $2 \times 10^{23}$  **B**  $6.02 \times 10^{23}$ 

 $C 12.04 \times 10^{23}$ 

**D**  $6.02 \times 10^{-23}$ 

Number of atoms = number of moles  $\times$  N<sub> $\Delta$ </sub>

Number of atoms =  $12 \times 10^{23}$  atom

### **Part 4: Stoichiometry**

## What is Stoichiometry?

Stoichiometry is the study of quantitative relationships between the amounts of reactants used and the amounts of products formed by a chemical reaction.

Stoichiometry is based on the law of conservation of mass. (The mass of reactants equals the mass of the products)

- Stoichiometry is based on the chemical equation and mole ratios between reactants and products

## **Steps for balancing equations**

- -Count the atoms of the elements in the reactants. If a reaction involves identical polyatomic ions in the reactants and products, count the ions as if they are elements
- -Count the atoms of the elements in the products

Change the coefficients to make the number of atoms of each element equal on both sides of the equation. Never change a subscript in a chemical formula to balance an equation because doing so changes the identity of the substance.

- Write the coefficients in their lowest possible ratio. The coefficients should be the smallest possible whole numbers.

## **Limiting Reactants**

- Reactions proceed until one of the reactants is used up and one is left in excess.
- The limiting reactant limits the extent of the reaction and, thereby, determines the amount of product formed.
- The excess reactants are all the leftover unused reactants.

## **Percent Yield**

- Laboratory reactions do not always produce the calculated amount of products.
- Reactants stick to containers.
- Competing reactions form other products.
- •The theoretical yield is the maximum amount of product that can be produced from a given amount of reactant.
- The actual yield is the amount of product actually produced when the chemical reaction is carried out in an experiment.

CH

3

CH

3

**A** 3

• The percent yield of a product is the ratio of the actual yield expressed as a percent.

$$Percent\ Yeild = \frac{Actualyeild}{Theoriticalyeild} \times 100\%$$

**→**B

- Percent yield is important in the cost-effectiveness of many industrial manufacturing processes
- **59** The mole ratios can be determined only if what?
- CH **A** All the reactants are present in unequal amounts
- **B** The reactants do not have coefficients 3
  - C The products do not have coefficients
  - **D** The equation is balanced

Mole ratio depends on balanced chemical equation →D

**D** 12

The coefficient x in the balanced chemical equation  $N_2 + xH_2 \rightarrow 2NH_3$  is ... CH **A** 3

**C** 2

3

 $\rightarrow$ A  $N_2 + 3H_2 \rightarrow 2NH_3$ 

- 61 Which of the following is the correct mole ratio for the following equation?  $Al(s) + Br_2(l) \rightarrow AlBr_3(s)$
- $\mathbf{CH}$ A 2 mol Al: 3 mol Br
- $\mathbf{B}$  3 mol Br<sub>2</sub>: 2 mol Al 3
  - C 2 mol AlBr<sub>3</sub>: 1 mol Br<sub>2</sub>
  - **D** 2 mol Br : 2 mol Al

Balanced chemical equation is

 $2Al(s) + 3Br_2(1) \rightarrow 2AlBr_3(s)$ 

3 mol Br<sub>2</sub>:2 mol Al

- Mass of reactants and mass of products in a chemical reaction...
- CH A Are not equal
- **B** Are increased equally 3
  - C Are equal
  - **D** are unrelated

The law of conservation of mass. (The mass of reactants equals the mass of the products)

65 The mass of the final product in a chemical reaction is based on what?

How many moles of CO<sub>2</sub> will be produced in

were 2 moles?  $CH_4 + 2O_2 \rightarrow CO_2 + 2H_2O$ 

The mole ratio between CH<sub>4</sub> and CO<sub>2</sub> is 1:1

**B** 4

stoichiometric calculations is:

A Actual yield

**B** Percent yield

C Theoretical yield

amount of reactant.

**D** Stoichiometric yield

the following reaction if the initial amount of CH<sub>4</sub>

The amount of product that can be produced from a given amount of reactants based on

The theoretical yield is the maximum amount of product that can be produced from a given

**C** 2

**D** 1

 $\rightarrow$ C

 $\rightarrow$ C

 $\rightarrow$ B

- CH A The amount of excess reactant
- 3 The amount of limiting reactant
  - The presence of a catalyst  $\mathbf{C}$
  - **D** The amount of  $O_2$  present

The amount of limiting reactant

10 How many moles of CO<sub>2</sub> will be produced when 4 moles of C<sub>4</sub>H<sub>10</sub> reacted with enough amount of oxygen.  $2C_4H_{10} + 13O_2 \longrightarrow 8CO_2 + 10H_2O$ Do **B** 4 **A** 2 It? **C** 8 **D** 16
